

I wanted to create a converter that will read pdf or converted docx files and take out limited information from three section described below:

- 1) Account Summary
- 2) **Withdrawals / Debits**
- 3) **Deposits / Credits**

There will be two tables with following schemas:

1. First Table: Account Summary
 - a. Year (take from the file name)
 - b. Month, (take from the file name)
 - c. Beginning Balance (USD)
 - d. Checks (Amount)
 - e. Withdrawals / Debits (USD)
 - f. Deposits / Credits (USD)
 - g. **Ending Balance (USD)**
2. **Second Table: Debit/Credit Summary**
 - a. Year (take from the file name)
 - b. Month, (take from the file name)
 - c. Type (**Withdrawals / Debits, Deposits / Credits**)
 - d. Date
 - e. Amount (USD)
 - f. Description (Details of transaction)

Other Instructions:

- 1) Convert pdfs to docx format
- 2) The doc reader should read only the required sections
- 3) Numbers, mostly in USD, should retain their sign, especially when they are negative
- 4) Results should be in CSVs
- 5) Compile data from all 14 docx files
